

Christmas Tree Care

We believe our Christmas trees are the freshest, longest lasting trees in Jacksonville. Trees are cut in New York, Pennsylvania and North Carolina, and shipped within days to arrive at our garden center about Thanksgiving time. They are immediately off loaded and drilled to allow each to stand in its own container of water. You will probably notice when you first set up your tree at home that it takes in considerably less water compared to trees you may have had in the past from other suppliers. That is because these trees have not been deprived of water for any significant amount of time.

Once you get your tree home, immediately place the trunk in a container of water. Christmas trees keep better outside in the moist, cool air but when you are ready to set it up, you can prolong its freshness by following these guidelines:

- 🌲 Choose a tree with a trunk that will fit into your stand. Don't whittle the sides of the trunk down to fit into the stand. The outer layers of wood are the most efficient at taking up water.
- 🌲 Use a stand that provides one quart of water per inch of trunk diameter.
- 🌲 If you make another fresh cut before installing your tree, it should be about 1/2 inch thick and cut perpendicular to the trunk. Don't bruise the cut surface or get it dirty, which would impede the flow of water.
- 🌲 Avoid locating your tree near any drying heat sources such as heat vents, fireplaces and direct sunlight.
- 🌲 Low heat lighting such as miniature / LED lights will reduce drying of the tree.
- 🌲 Check the water daily and be sure that the base of the tree is always submerged in water.
- 🌲 Use **Prolong** to lengthen your tree's life even more.
- 🌲 Keep the temperature in your home as low as is comfortable.

What to do with your tree after Christmas

- Prop tree against a bird feeder to allow better access and protection for the birds.
- Grind the tree for mulch.
- Store for later burning.
- Sink into ponds for fish and frogs to use for cover.
